

HyperText Markup Language (HTML)

- HTML (Hypertext Markup Language) is a **markup language** that allows users to create **static web pages**.
- An HTML file contains **markup tags (elements)**.
A **tag** is a text instruction that tells the web browser **how to display** the contents between the tags.

- An HTML file must have a **.htm** or **.html** file extension.
- The file can be created using a text editor.

heading

This is my first web page.

I like to learn HTML

bold, italic

HTML Tags

- HTML tags are keywords surrounded by **angle brackets** like `<html>`
- HTML tags normally come in **pairs**.
- The first tag in a pair is the **start tag**, the second tag is the **end tag**.

The general format of an HTML tag:

<tagname attribute = "value">.....</tagname>

Start tag

tag content

End tag

- The **start tag** indicates the beginning of a command and the **end tag**, with a forward slash (/) inside it, indicates where that command should end.
- HTML tags are **not case sensitive**.
- HTML tags can have **attributes**.

- Attributes provide **additional information** about the tag to the browser.
- Attributes are always **specified in the start tag**.

Example:

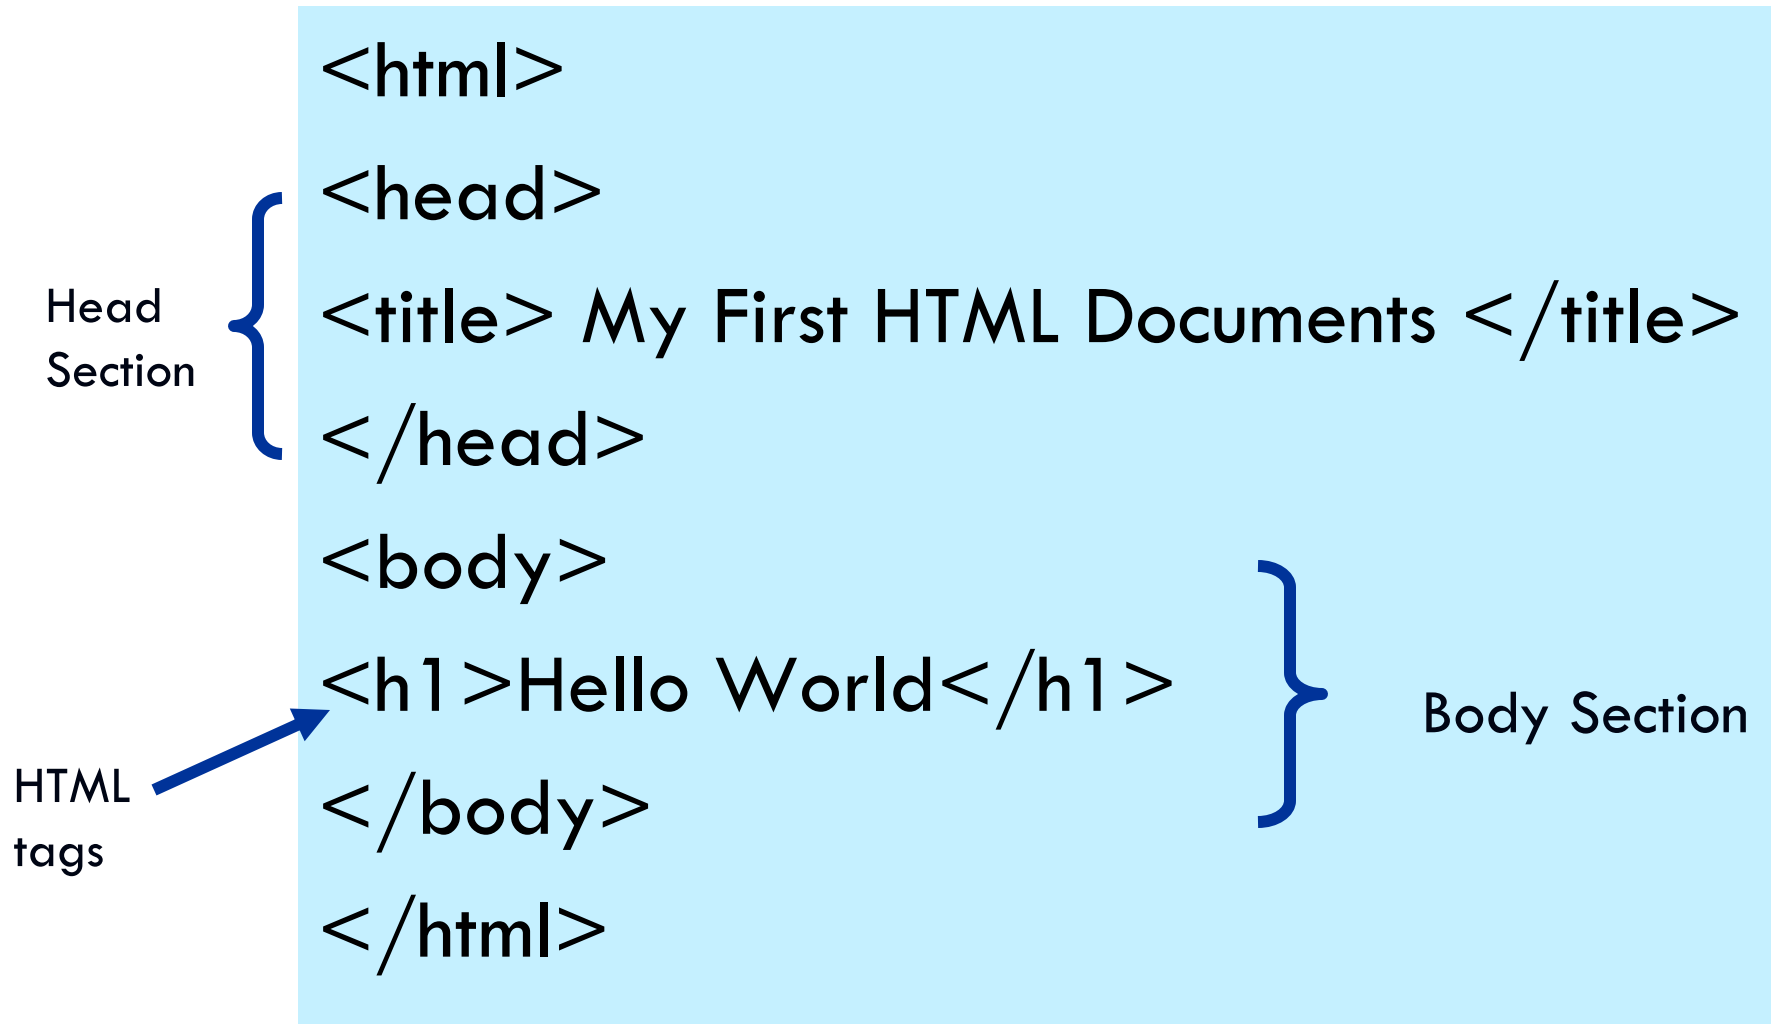

- Elements (tag) with no tag content are called **empty tags**.

- An empty tag takes the following format:

<tagname attribute = “value” />

Basic Structure of an HTML Document

- HTML documents start with the `<HTML>` tag and ends with `</HTML>`.
- HTML documents are divided into two sections: the `head` and the `body`.
- The head section contains `information about the document` such as the title of the web page, information about the web page required for search engines, style sheets etc.

- The head section starts with the `<HEAD>` tag and ends with `</HEAD>`.
- Information contained in the head section is not displayed within the browser.

- The body section contains the **contents** of the web page.
- The body section starts with the **<BODY>** tag and ends with **</BODY>**.

HTML Tags

Tags used in the Head Section

- `<title>` - Defines the document title.
- `<meta>`
 - Provides meta-information about the web page, such as descriptions and keywords for search engines, refresh rates etc.
 - It has no end tag.

Attributes:

Attribute	Values	
http-equiv	refresh	For creating automatic jumps to other pages, setting refresh rates etc.
name	description keywords	For identifying extra information on the web page.
content	Some text	Adds extra information about the web page. It is associated with http-equiv or name attributes.

Examples:

1. Define keywords for search engines

Define a set of key words to describe a web page created to give information about the Internet Technology module.

```
<meta name="keywords" content="HTML, CSS,  
JavaScript" />
```

- Define a description of web page for search engines

Give a description about a web page created to give information about the Internet Technology module.

```
<meta name="description"  
content="Internet technology module will teach you  
HTML, CSS, PHP and JavaScript" />
```

3. Refreshing a web page

Refresh the web page every 5 seconds

```
<meta http-equiv="refresh" content="5" />
```

4. Redirecting a user to another web page

Redirect the web page to www.nsbm.lk after 2 seconds.

```
<meta http-equiv="refresh" content="2;  
url=http://www.nsbm.lk"/>
```

Tags used in the Body Section

Attributes of the <body> tag:

Attribute	
background	Specifies a background image
bgcolor	Specifies a background color
text	Specifies the color of the text

Example:

```
<body bgcolor="black" text="white">
```

```
.....
```

```
</body>
```

```
<body background="picture1.jpg" >
```

```
.....
```

```
</body>
```

Example 1:

- Create an HTML document with the following effects:
 - Set the page title to “*Welcome to My First Web Page*”
 - Set the background color to “*black*”.
 - Set the text color to “*yellow*”
 - Include the text “*I like to learn HTML*”

```
<html>
```

```
<head>
```

```
<title> Welcome to My First Web Page</title>
```

```
</head>
```

```
<body bgcolor="black" text="yellow">
```

```
I like to learn HTML
```

```
</body>
```

```
</html>
```

Welcom to My First Web Page - Microsoft Internet Explorer

File Edit View Favorites Tools Help

Address  C:\Documents and Settings\Gangani\Desktop\first.html

Google   

I like to learn HTML

Example 2:

Create a web page to include the following:

- Page title – ABC Bookworld Ltd.
- Page background - #F8F400
- Text color - #3D001C
- Set of suitable keywords for search engines.

- Redirect the page to <http://www.abcbookmain.com> after 10 seconds.
- Page contents : a message indicating that the user will be redirected to the bookshop main page.

```
<html>
```

```
<head>
```

```
<meta name="keywords" content="books, CDs,  
Magazines" >
```

```
<meta http-equiv="refresh" content="10;  
url=http://www.abcbookmain.com" >
```

```
<title> ABC Bookworld Ltd</title>
```

```
</head>
```

```
<body bgcolor="#F8F400" text="#3D001C">
```

```
  You will be redirected to our main page in 10  
  seconds </body>
```

```
</html>
```

Basic Paragraph Text Tags

Paragraphs

- The **<p>** tag marks the beginning of a paragraph.
- **</p>** tag is optional.
- HTML automatically leaves an extra blank line before and after a paragraph.

Attributes:

Align (values: Center, left, right and justify).

Example:

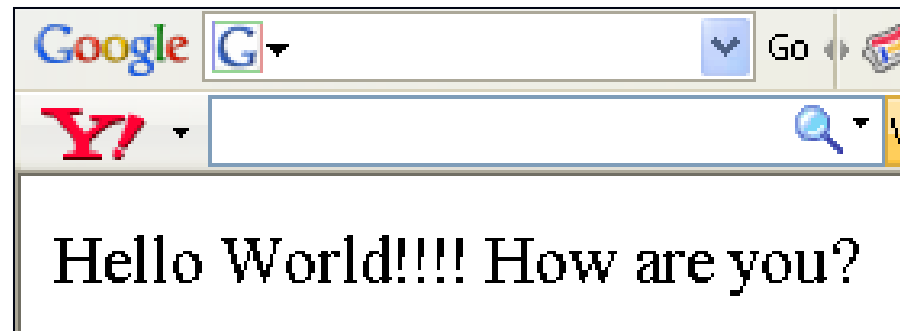

```
<p align = "center">
```

This paragraph is center aligned

```
</p>
```

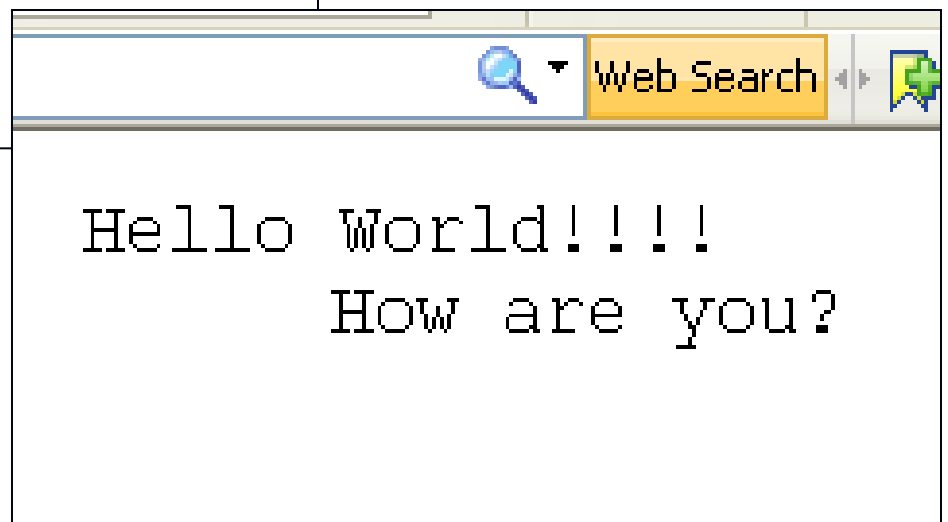

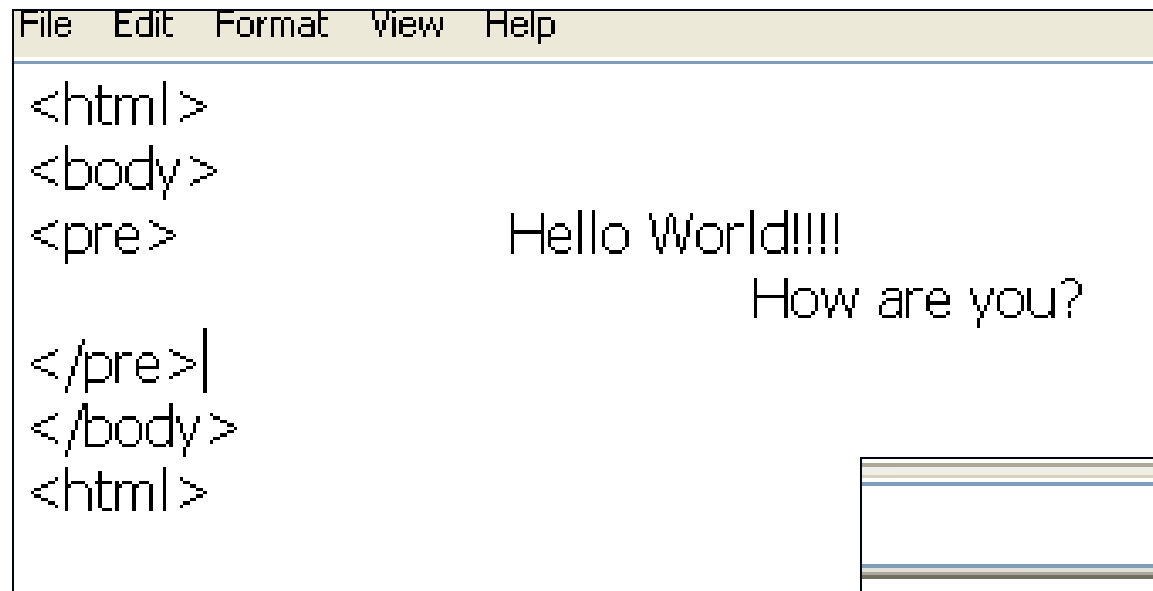

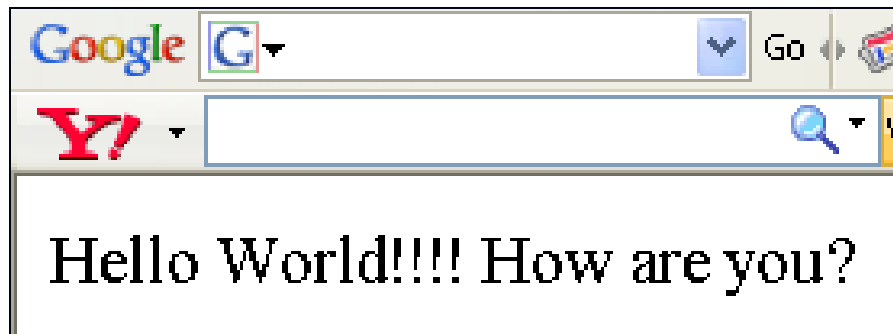

Line Breaks

- The **
** tag is used to end a line without starting a new paragraph. The tag forces a line break wherever it is placed.
- The `
` tag has no end tag.

Preformatted Text

- The **<pre>** tag defines preformatted text. The text enclosed in the pre element usually preserves spaces and line breaks.

Horizontal Rule

- The **<hr>** tag inserts a horizontal rule.
- The tag has no end tag.

Center

- The **<center>** tag centers its enclosed text horizontally.

Example 2:

Create the following web page using HTML:

Sun Ray Holiday Resorts

Sun Ray is a beach hotel where you can have the best holiday ever.

For more information please contact:

Bookings Manager

Tel: 234-5677 or 234-5688

```
<html>
```

```
<body>
```

```
<center> Sun Ray Holiday Resorts</center>
```

```
<hr>
```

```
<p>Sun Ray is a beach hotel where you can <br>  
have the best holiday ever. </p>
```

```
<hr>
```

For more information please contact:

```
<pre>    Bookings Manager
```

```
                Tel: 234-5677  or  234-5688
```

```
</pre>
```

```
</body>
```

```
</html>
```

Comments

- Comments are ignored by the browser.
- A comment is written between the `<!--` and `-->` symbols.

Example:

```
<!-- This is a comment -->
```

Lists

- Two types of lists are supported in HTML:
definition (glossary) lists and regular lists.

- Definition Lists

Contains a term followed by a definition.

- A definition list starts with the **<dl>** tag. Each definition-list term starts with the **<dt>** tag and each definition of a term starts with the **<dd>** tag.

- Example:

Create the following definition list:

CPU

Central Processing Unit

RAM

Random Access Memory

Example:

<dl>

<dt> CPU </dt>

<dd> Central Processing Unit </dd>

<dt> RAM </dt>

<dd> Random Access Memory </dd>

</dl>

Example 2:

Create a web page using HTML to display the following definition list:

Mount Everest

Tallest Mountain in the world

Nile

Longest river in the world

Angel Falls

Highest waterfall in the world

<dl>

<dt> Mount Everest </dt>

<dd> Tallest Mountain in the world </dd>

<dt> Nile </dt>

<dd> Longest river in the world </dd>

<dt> Angel Falls </dt>

<dd> Highest waterfall in the world </dd>

</dl>

■ Regular Lists

Regular lists can be categorized as **ordered lists** and **unordered lists**.

Ordered Lists

It is a list of items with the list items marked with numbers.

- An ordered list starts with the `` tag. Each list item starts with the `` tag.

Example 1:

Create the following ordered list:

1. Apples
2. Oranges
3. Grapes

```
<ol>
```

```
<li> Apples </li>
```

```
<li> Oranges </li>
```

```
<li> Grapes </li>
```

```
</ol>
```

Unordered Lists

It is a list of items with the list items marked with bullets.

An unordered list starts with the `` tag. Each list item starts with the `` tag.

Example:

Create the following unordered list:

- Cricket
- Football
- Chess

```
<ul>
```

```
<li> Cricket </li>
```

```
<li> Football </li>
```

```
<li> Chess </li>
```

```
</ul>
```

Example 2:

Create a web page using HTML to display the following ordered list:

Item list:

1. Books
2. CDs
3. Stationary
4. Toys

Text Styles

Headings

- Headings are defined with **<h1>** to **<h6>** tags.
<h1> defines the largest heading. <h6> defines the smallest heading.
- HTML automatically adds an extra blank line before and after a heading.

Attributes:

Align (values: Center, left and right).

Example:

```
<h1 align = "center"> This is a heading </h1>
```

H1 → **Heading 1**

Heading 2 ← H2

H3 → **Heading 3**

Heading 4 ← H4

H5 → **Heading 5**

Heading 6 ← H6

Bold Text

- The **** tag displays text in boldface.

Italic Text

- The **<i>** tag displays text in italics.

Underlined Text

- The `<u>` tag displays text that is underlined

Fonts

- The **** tag specifies the font face, font size, and font color of text.

Example:

```
<font face="Arial" color="red" size="1" >
```

Hello World

```
</font>
```

Note:

A value of 3 for the size attribute represents the browser's default size for text (usually 16 pixels).

Example:

Create the following web page using HTML:

H1 heading

Font face: Arial

Color: red

Font face: Tahoma

Size: 4

Font face: Garamond

Size: 6

Book Sale !!!!

Over 40% discount on all
Computer Science textbooks....

Hurry come and visit our bookshop.

```
<html>
<body>
<h1 align="center"><font face="Arial"
Color="red">Book Sale!!!</font></h1>
<p><font face="Tahoma" size="4">Over
<u>40%</u> discount on all<br>
<b>Computer Science</b>
textbooks....</font></p>
<p>
<i><font face="Garamond" size="6">Hurry
come and visit our bookshop.</font></i></p>
</body>
</html>
```

Hyperlinks

- The **<a>** tag (anchor tag) is used to create links.
- Creating links to other web pages:
 - Syntax:

****

Example:

** Click Here **

Example:

Create the following web page using HTML:

Sorry We have moved!!

You will be automatically redirected to
our new site in 10 seconds or click the link
given below:

[Visit New site](http://www.bookshop.com)

Hyperlink to:
<http://www.bookshop.com>

```
<html>
```

```
<head>
```

```
<meta http-equiv="refresh" content="10;  
  url=http://www.bookshop.com"></head>
```

```
<body>
```

```
<h1 align="center">Sorry we have moved</h1>
```

```
<p> You will be automatically redirected to <br>our  
  new site in 10 seconds or click the link <br>given  
  below:</p>
```

```
<center>< a href="http://www.bookshop.com"> Visit  
  new site</a> </center>
```

```
</body></html>
```

Images

- The **** tag places an image in an HTML document. It has no end tag.
- Syntax:
 - **** where src = "URL" specifies the location of the image on the server.
 - Attributes: align (values: left, right), width, height

Example 1:

Create the following web page using HTML.

Use suitable formatting.

School.jpg

Hello World!!!!

This is my School.

```
<html>
```

```
<body>
```

```

```

```
<h1 align="center"><font color="red">Hello  
World!!!</font></h1>
```

```
<h3 align="center"><i>This is my school </i></h3>
```

```
</body>
```

```
</html>
```

Example 2:

Create the following web page using HTML.

Add a suitable title, a background color, font types and font sizes to the document.

House.jpg

House for Rent

A two bedroom house for rent at:

120, Wijerama Lane,

Colombo.

Monthly rental :Rs 8,000

```
<html><head>
```

```
<title>House for Rent</title></head>
```

```
<body>
```

```

```

```
<h1 align="center"><font color="red"><u>House  
for rent</u></font></h1>
```

```
<p><font face="Garamond" size="4">A two  
bedroom house for rent at:<br>
```

120, Wijerama Lane,

Colombo.

<font face="Tahoma" size="5"

color="blue"><u><i>Monthly rental : Rs 8,000

</i></u>

</p>

</body>

</html>

Tables

- Tables are defined with the **<table>** tag.
- A table is divided into rows with the **<tr>** tag, and each row is divided into data cells with the **<td>** tag.
- Headings in a table are defined with the **<th>** tag.

Attributes:

Border	Adds a border to the table. A value 0 means no border as measured in pixels.
Align	Alignment of table or text within individual cells. (values : left, center, right).
Bgcolor	Background color of table or individual cells.

Width	Specifies the width of the table (in terms of pixels or as a percentage) or of individual cells.
Cellpadding	Setting of space (in pixels) between a cell's content and its borders.
Cellspacing	Setting the amount of space (in pixels) between cells.

Example 1:

Write the HTML code to display the following table:

Student No	Name
ST100	Nimal
ST200	Mala

```
<html><body>
<table>
<tr><th> Student No. </th>
<th> Name </th></tr>
<tr><td>ST100</td>
<td>Nimal</td></tr>
<tr><td>ST200</td>
<td>Mala</td></tr>
</table>
</body></html>
```

Student No.	Name
ST100	Nimal
ST200	Mala

Example 2:

Design an HTML document to display the following table:

Item	Price
Rice	70
Sugar	60
Dhal	75
Flour	40

```
<html><body>
<table border="1">
<tr><th>Item</th>
<th>Price</th></tr>
<tr><td>Rice</td>
<td align="center">70</td></tr>
<tr><td>Sugar</td>
<td align="center">60</td></tr>
.....
</table>
</body></html>
```

Item	Price
Rice	70
Sugar	60
Dhal	75
Flour	40

With cell padding

Item	Price
Rice	70
Sugar	60
Dhal	75
Flour	40

With cell spacing

Item	Price
Rice	70
Sugar	60
Dhal	75
Flour	40

Table Captions

- The **<caption>** tag creates a table caption.
- The tag should appear directly below the <table> tag, before the first <tr>.
- Attributes:
 - Align (values : top, bottom, left , right).

Example 2:

Create the following table:

Town	Province
Colombo	Western
Kandy	Central
Galle	Southern

Towns & Their Location

```
<html><body>
```

```
<table border="1" align="center" width="50%">
```

```
<caption align="bottom"> Towns & Their Locations  
</caption>
```

```
<tr bgcolor="green">
```

```
<th> Town</th>
```

```
<th>Province</th></tr>
```

```
<tr bgcolor="blue"><td>Colombo</td>
```

```
<td align="center">Western </td></tr>
```

```
<tr><td>Kandy</td>
```

```
<td align="center">Central</td></tr>
```

```
<tr bgcolor="blue">
```

```
<td>Galle</td>
```

```
<td align="center">Southern</td></tr>
```

```
</table>
```

```
</body>
```

```
</html>
```

Starting the web page:

```
<!DOCTYPE HTML PUBLIC “_//w3c/DTD HTML 4.0//EN”>
```

Declares the version of HTML the page is using
